In brief

Using the Advanced Custom Field Plugin we can add Custom image field to any taxonomy (default category or any custom made one). To get the value of that custom field we can use the function `get_field()`;

Using the Advanced Custom Field Plugin we can add Custom image field to any taxonomy (default category or any custom made one). To get the value of that custom field we can use the function `get_field()`;

Eg : to get value from a taxonomy named "category" and its id is "3" use

```
$value = get_field('field_name', 'category_3');
```

for the function the 1st parameter is the custom field name and 2nd parameter is the category string in the format "\$type_\$id".
