In brief

Custom watch faces from the Amazfaces app won't install on your Amazfit smartwatch because there is no free storage slot available. To fix this, manually delete one preinstalled watch face from your watch, then click Install in the Amazfaces app.

If you are using the Amazfit smartwatch, whatever model it is, whether it is GTS, GTR, GTS Mini, etc., you might have noticed that the inbuilt watch faces are minimal. Even if you check the Zepp app, the number of different watch faces is also not great.

However, for Amazfit users, some third-party apps are available in the Playstore Appstore that can be installed on Android and iPhone to install additional Watchfaces. Amazfaces is such an app that is free to download and has many watch faces to select from.

Not Able to Install Amazfit Watch Faces From Amazfaces

Most Amazfit users face the issue of not installing additional watch faces on the Amazfit watch from the Amazfaces app. The point is true, but not due to any error related to Amazfit Watch Faces. Here, the problem is the lack of information regarding the issue. This article will check why the Amazfaces watch faces are not installed on the Amazfit smartwatch and how to fix the problem.

Why the Amazfaces Watch Faces can't be installed on the Amazfit App

As said before, the Amazfaces app is one of the best apps for Amazfit that can be installed on Android and iPhone. Once installed, you can select the watch model you are using, and then you need to connect to the device from the app. After the connection has been established, you can search for your watch's list of watch faces.

Finally, you can install your preferred watch face on your device using the app. Simply clicking on the Install button from the Amazface watch app will install the watch face on the smartwatch.

But, most users are facing the issue here. Once they click on the Install button, nothing will happen. There won't be any errors or notifications. The app will still show the connecting information, and nothing will happen.

The issue is due to the memory and the inbuilt watch faces on the Amazfit watch. Once no additional free slots are available, the Amazfaces app won't install the new custom watch faces from the app.

How to Fix the Watch Face Not Installing on Amazfit Watch

To install custom watch faces from the Amazfaces app. First, delete one of the preinstalled watch faces from the Amazfit watch.

So that there will be enough space to install additional watch faces on the device. However, it should be noted that on the Amazfit smartwatch, you can store only one custom watch face at a time. So the next time when you install a new watch face, it will overwrite the previously stored watch faces.

That is why the custom watch faces are not installed for the first time. If you are trying to install the Amazfaces watch faces for the first time, the app cannot overwrite the inbuilt watch faces available on the smartwatch.

We need to manually delete one of the watch faces from the smartwatch and then click on the Install button on the Amazfaces app.

Then the installation will start, and the custom watch faces get installed on the Amazfit smartwatch without any issue.

Do I have to delete the Watchfacs each time I install new Custom Watch faces?

You must delete preinstalled watch faces from the smartwatch for the first time. Next time, while trying to install a new custom watch face from the Amazface app, it will overwrite the previously installed watch face. So, deleting the watch face from the watch is needed only for the first time.

Is it Safe to Install the Amazfaces App?

Even though it is a third-party app, we can't say it is unsafe. There is no issue in using the app for custom watch faces for your Amazfit smartwatch. However, since the watch faces available within the Zepp app are limited, Users need to consider third-party apps like Amazfaces to get custom watch faces.

Why are the Amazfit Zepp App Watch Faces not working on Amazfit Watches?

In most cases, the watch faces available within the Zepp App work with all the Amazfit watches. If you are experiencing an issue with your Amazfit watch and Zepp App, try to restart the mobile and watch. Then, after reboot, ensure the Bluetooth connectivity is established, and your Amazfit watch is connected to the Zepp App.
