Open the program. The first thing you will do is analyze what storage units are in the computer. Once done, this will show you in a window.

Choose which disk you want to scan. You can choose what the system has found or indicate a specific folder through the search tool arranged in the lower part of the window.

Once the disk to be scanned has been selected, the system will start searching for the files. This process could last from a few seconds to several minutes. Everything depends on the size of the unit to be checked. The system will perform a quick scan and immediately after, it will begin a deep one to locate more lost files.

When the software has located the lost files, it will show you a list, and you can select only those in which you are interested. Then, you can preview them before deciding to recover them. After making the selection, you must check the option 'Recover.'

Finally, it establishes to what folder you want it to be extracted and ready. Again, remember that you should not save it in the same unit where the file was recovered for security.

### Conclusion:

As you have seen in the previous section, recovering deleted files with the EaseUS Data Recovery Wizard software is extremely simple. Just three steps: start, scan, recover. In addition, the software offers the possibility to select the files and preview them before moving on. This way, you can decide what to recover and what not.
